ASSIGNMENTS

Week 1:

Practice Problems 1:

Q.1: Find the mean of 5,10,15,20,25.

Q.2: Find the mean of the given data set: 10,20,30,40,50,60,70,80,90.

Ans - 50

Q.3: Find the mean of the first 10 even numbers.

Q.4: Find the mean of the first 10 odd numbers.

Practice Problems 2:

1. The marks in a subject for 12 students are as follows:

2. Given below are heights of 15 students of a class measured in cm: 128, 144, 146, 143, 136, 142, 138, 129, 140, 152, 144, 140, 150, 142, 154 Find the range of the given data.

3. Calculate the range of the data given below:

Class
$$30-40$$
 $40-50$ $50-60$ $60-70$ $70-80$ $80-90$ $90-100$ Frequency 2 3 8 15 12 7 3

Ans: Range = 100-30 = 70

Practice Problems on Standard Deviation:

- 1. Calculate the standard deviation of the following values:
- 5, 10, 25, 30, 50.

Mean
$$(\bar{n}) = (5+10+25+30+10)/5$$

$$= 120/5 = 24$$
Now,
$$n_1 - \bar{n} = 5-24 = -19$$

$$n_2 - \bar{n} = 25-24 = 1$$

$$n_3 - \bar{n} = 25-24 = 1$$

$$n_4 - \bar{n} = 30-24 = 6$$

$$n_5 - \bar{n} = 50-24 = 26$$
Now,
$$\sum_{i=1}^{5} (n_i - \bar{n})^2 = (19)^2 + (-14)^2 + 1^2 + 6^2 + (21)^2$$

$$= 361 + 196 + 1 + 36 + 676$$

$$S \cdot D = \int_{\frac{5}{12}}^{\frac{5}{12}} (n_i - \bar{n})^2$$

$$= \sqrt{1240} = \sqrt{317 \cdot 25}$$

$$= \sqrt{1240} = \sqrt{317 \cdot 25}$$

2. Find the mean and standard deviation for the following data.

X	60	61	62	63	64	65	66	67	68
f	2	1	12	29	25	12	10	4	5

Ans:												
	-				124							
	x:]	P 1										
		fi	fini	212	fizi2							
	60	2	120	3600	7200							
	61	1	61	3721	3721							
	62	12	744	3844	46128							
	63	29	1827	3969	115101							
	64	25	1600	4096	102400							
	62	12	7-80	4225	50700							
	27	10	660	4356	43560							
	67	.4	268	4489	17956							
	68 5		340	40 4824624 2								
		54	Zfixi =		Efini2 =							
	30/	= 100	6400		409886							
		- 100										
N												
Mean = n = Epini = 6400 = 64												
Mean = $\bar{n} = \frac{\sum_{i \neq i}}{N} = \frac{6400}{100} = 64$												
62-11-5												
$\int_{N}^{2} = \left(\frac{1}{N} \sum_{i} f_{i} n_{i}^{2}\right) - \left(\frac{1}{N} \sum_{i} f_{i} n_{i}\right)^{2}$												
- (10												
= (4098.86) - 4096												
62 = 2.86												
S.D = 8 = \[\frac{2.86}{2.86} = 1.69 \frac{4}{9} \]												

3. The diameters of circles (in mm) drawn in a design are given below:

Diameters 33 – 36 37 – 40 41 – 44 45 – 48 49 – 52 No.of circles 15 17 21 22 25

Calculate the standard deviation and mean diameter of the circles.

Probability Problems:

1. Two dice are thrown together. Find the probability that the product of the numbers on the top of the dice is: (i) 6 (ii) 12 (iii) 7

- i) Two dice are thrown together So, total possible outcomes = 6x6 = 36Desirable Outcomes = $\{(1,6),(6,1),(2,3),(3,2)\}$ Probability = 4/36 = 1/9
- ii) Total possible outcomes = 6x6 = 36Desirable Outcomes = $\{(2,6),(6,2),(4,3),(3,4)\}$ Probability = 4/36 = 1/9
- iii) Since, no combination can result in the product=7, so,Probability = 0
- 2. A bag contains 10 red, 5 blue and 7 green balls. A ball is drawn at random. Find the probability of this ball being a (i) red ball (ii) green ball (iii) not a blue ball
- i) Total possible outcomes = 10+5+7 = 22 Desirable Outcomes = 10 Probability =10/22 = 5/11
- ii) Total possible outcomes = 22Desirable Outcomes = 7Probability = 7/22
- iii) Total possible outcomes = 22Desirable Outcomes = 7+10=17Probability = 17/22

- 3. All the jacks, queens and kings are removed from a deck of 52 playing cards. The remaining cards are well shuffled and then one card is drawn at random. Giving ace a value 1 similar value for other cards, find the probability that the card has a value (i) 7 (ii) greater than 7 (iii) less than 7
- i) Total possible outcomes = 52-(4x3) = 40 Desirable Outcomes = 1x4 = 4 Probability = 4/40 = 1/10
- ii) Total possible outcomes = 40Desirable Outcomes = 3x4 = 12Probability = 12/40 = 3/10
- iii) Total possible outcomes = 40Desirable Outcomes = 6x4=24Probability = 24/40 = 6/10 = 3/5
- 4. A die has its six faces marked 0, 1, 1, 1, 6, 6. Two such dice are thrown together and the total score is recorded. (i) How many different scores are possible? (ii) What is the probability of getting a total of 7?
- i) Possible scores are = $\{(0+1), (1+1), (1+6), (0+6), (6+6), (0+0)\}$ = 6 different scores are possible.
- ii) For a total of 7, 1 dice must show 1 and the other dice must show 6.

So, Probability of dice showing $1 = 3/6 = \frac{1}{2}$

Probability of dice showing $6 = 2/6 = \frac{1}{3}$

Therefore, total probability = $\frac{1}{2}$ * $\frac{1}{3}$ + $\frac{1}{3}$ * $\frac{1}{2}$ = 2/6 = 1/3

Practice Questions:

1) Differentiate $f(x) = 6x^3 - 9x + 4$

Ans:
$$18x^2 - 9$$

2) Differentiate $f(x) = x^3 - 2x^2 + x - 1$

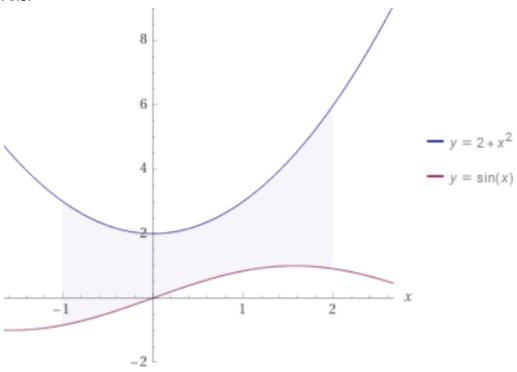

Ans:
$$3x^2 - 4x + 1$$

3) Find: $\int 6x^5 - 18x^2 + 7 dx$

Ans:
$$x^6 - 6x^3 + 7x + c$$

4) Find the area under the curve for $y = x^2 + 2$, $y = \sin x$, x = -1 and x = 2

Area enclosed =
$$\int_{-1}^{2} (2 + x^{2} - \sin(x)) dx$$
=
$$\int_{-1}^{2} |2x + x^{3}/3 + \cos(x)|$$
=
$$[4+8/3 + \cos(2)] - [-2 - \frac{1}{3} + \cos(-1)]$$
=
$$9 - \cos(1) + \cos(2)$$
=
$$8.043 \text{ sq. units}$$
